<u>Overall comments</u>

<u>Positives</u>
Reference made to OWASP from our module materials, helping to position your work within the
        wider field.
A well detailed use case model demonstrates expertise in this aspect of UML. I would have liked to
        have seen it showcased earlier in the report.

<u>Negatives</u>
The assessment specification requests that one of three domains are used as case studies around
        which your code development will be structured, however, unfortunately, one of these
        domains has not been selected.
There are opportunities in places to make the UML more precisely defined and to exploit it more
        fully in its capability for representing a scenario.
I would like to see some greater justification for the decision to use 3rd party tools than the fact
        that they will make the development process quicker. The goal of this assessment is to
        examine your knowledge and understanding of security practices as a priority, and without
        this specific detail, there is less of an opportunity to assess this.

<u>Overall grade: Pass</u>
